Question as posed to ChatGPT -

What is the difference between pseudo 3-D and true 3-D with references?

Answer:

Pseudo 3-D is a computer-generated representation of a two-dimensional surface while true 3-D involves representing data in three dimensions, including depth and volume.

References:

1. https://en.wikipedia.org/wiki/3D_modeling
2. <https://www.geospatialworld.net/blogs/true-3D-versus-pseudo-3d-mapping/>

Comments by EFB:

- There must be a better way to ask this question. While the computer-generated answer is not “wrong,” much more can and/or should be included.
- The computer-generated response did include references as requested.
- The references provided do not really address the question asked. A better reference would be <http://www.globalcogo.com/true-versus-pseudo.pdf>.
